Fitting a Yuasa TEV Battery Top

You will need a 10mm socket set and ratchet.

Fitting the new cap is very easy but please do follow these guidelines.

1. Your new battery was supplied with the fixing screws and washers to fit the new cap, if you are fitting a replacement cap, please retain the original screws and washers.
2. Place the cap over the battery, it will only go one way round and line it up with the threaded holes in the battery terminals.
3. Put the barbed nut over the nut and drop it into the hole of the battery cap, carefully using a socket turn the bolt clockwise with finger pressure only (to avoid any cross threading) until the thread is done up. Repeat on both sides.
4. Now, with your ratchet bar use only moderate pressure to tighten both nuts firmly.
